Problem 7-1. Use the following data for the next 7 questions. A borrower had contracted to purchase a house for $200,000 and can obtain an 80% loan with a 30 year term at 5%, or a 90% loan with a 30 year term at 5.5%.
1. What is the payment on the 80% loan?
2. What is the balance after 3 years on the 80% loan?
3. What is the payment on the 90% loan?
4. What is the balance after 3 years on the 90% loan?
5. What is the incremental cost (expressed as an APR) of the top 10% of the second loan (assume you stay 30 years)?
6. What is the incremental cost (expressed as an APR) of the top 10% of the second loan (assume you stay 3 years)?
7. For the previous question, what is the incremental cost (expressed as an APR) if you were charged 3 points on the 90% loan. 21.85%

Problem 7-2. Use the following data for the next 8 questions. You are considering which financing alternative to choose for your proposed house purchase (250,000 house). You have $12,500 available for a down payment. Option A: Get a 95% loan at 6.5%, with 2 points. Option B. Get an 80% loan for 5%, (with no points) and a second mortgage at 8% (with 3 points) for your remaining needs. All loans have a 15 year term.
1. What is the payment for Option A?
2. What is the loan balance after 4 years for Option A?
3. What is the combined payment on Option B?
4. What is the combined loan balance after 4 years for Option B?
5. What is the cost of Option A (expressed as an APR) if you stay 15 years?
6. What is the cost of Option B (expressed as an APR) if you stay 15 years?
7. What is the cost of Option A (expressed as an APR) if you stay 4 years?
8. What is the cost of Option B (expressed as an APR) if you stay 4 years? 5.63%

Problem 7-3. Use the following data for the next 8 questions. You are considering refinancing your current mortgage that you took out 4 years ago (Note amount $160,000, term 30 yr, note rate = 6%). You can refinance to a 5% loan (term 30 years) at a cost of 2.5 points. Because you have no savings, you will add the refinancing costs to your current loan. You expect you will keep your new loan for 3 years.
1. What is your current loan payment?
2. What is your current loan balance?
3. If you do not refinance, what will your balance be 3 years from now?
4. If you refinance, what will your starting note balance be? (Note: Example done in class was approximately correct; the answer here is the exact amount). 155,264.92 (= 151,383.30/0.975)
5. If you refinance, what will your new payment be?
6. How much will you save in payments each month if you refinance?
7. If you refinance, how much higher will your loan balance be 3 years from now?
8. If you invest your monthly savings at 4%, how much will you have 3 years from now, over and above the higher loan balance you face 3 years from now? 190.62
Problem 7-4. Use the following data for the next 5 questions. Secondary Market Purchasing Company is considering purchasing your mortgage from the financial institution that currently holds it. You took out a 230,000, 15 year, 6.5% mortgage two years ago.
1. What is your current loan payment?
2. What is your current balance?
3. What will your balance be 4 years from now?
4. If SMPC wants a 7% return on its purchase, and believes you will keep the mortgage full term, how much should SMPC pay for your loan?
5. If SMPC thinks you will pay off your loan 4 years from now, how much should it pay given that it wants a 7% return on its purchase? 207,335.56

Problem 7-5. Use the following data for the next 6 questions. You have a choice between two identical townhouses in the same complex. You have $30000 available for a down payment. Home A is priced at $150,000. You can get a conforming mortgage with a 20 year term for 80% of its value at 6.5%. Home B is priced at $155,000 and you can assume the existing balance of $100,000 at 5% (with 20 years remaining) and get a second mortgage at 8%, also with a 20 year term.
1. What is the payment for Home A?
2. What will your balance be after 5 years for Home A?
3. What is the payment (combined) for Home B?
4. What will your balance (combined) be after 5 years for Home B?
5. If you stay for 20 years, which home has the lowest cost? Home B due to lower payments
6. If you stay for 5 years, at what rate must you invest your monthly savings to recover your higher loan balance at that time? 20.30%

Problem 7-6. Use the following data for the next 6 questions. A homebuilder is offering $150,000 loans for his homes at 5% for 15 years. The market rate is 5.5% for 15 years.
1. What is the payment on the builder’s loan?
2. What is the balance after 5 years on the builder’s loan?
3. What is the payment on a market rate mortgage?
4. What is the balance after 5 years on the market rate mortgage?
5. If the builder believes you would take his mortgage for the entire 15 year term, how much of a price premium does he have to build into his house price?
6. If the builder believes you would take his mortgage for a 5 year period, how much of a price premium does he have to build into his house price? 2,898.97
**Problem 7-7.** Use the following data for the next 3 questions. In response to increasing interest rates, a homebuilder has introduced a 30-20-10 program in which she will reduce your mortgage payment by 30% the first year, 20% the second year, and 10% the third year. You are seeking a $200,000, 30 year loan at 6%.
1. What will your payment be with no payment subsidy?
2. What will your first year payment be with the subsidy?
3. What is the PV of the subsidy you receive during year 3?
4. If the bank issuing the loans requires a 6% return on the loan, how much must the builder pay the bank as a single payment at loan closing to compensate the bank for the lower payments?
5. What is your cost for the loan (expressed as an EAR) if you keep the loan the full term? 5.78%

**Problem 7-8.** Use the following data for the next 7 questions. An appraiser is looking for comparable sales and finds a house that recently sold for $250,000. She determines that the buyer was able to assume the seller’s mortgage which had a 5.5% interest rate. The balance at the time of the sale was $190,000 with 15 years remaining. The current market rate for a 15 year mortgage of that size is 6.5%.
1. What is the payment on the mortgage that was assumed?
2. What is the balance on this loan 6 years from now?
3. What is the payment on a new mortgage of the same size and term?
4. What is the balance on this loan 6 years from now?
5. Assuming the loan is held to term, what is the value of assuming the loan?
6. What is the cash equivalent value of the house on which the loan was assumed, projecting that the loan was held to term?
7. What is the cash equivalent value of the house on which the loan was assumed, projecting that the loan was held for 6 years? 241,827.26
